

Ofer Waron 97% Gold Trading Algorithm

Ofer Waron 97% Gold is a proprietary trading algorithm developed for short-term gold trading (XAU/USD), focused on identifying high-probability market setups with strict validation and disciplined execution.

The system is built entirely on price behavior and internal market dynamics, without reliance on news, sentiment, or external data sources. Its design prioritizes clarity, timing, and risk control over trade frequency.

Core Methodology

- **Rule-Based Decision Engine** — all signals are generated from predefined, data-driven conditions
- **Multi-Confirmation Logic** — trade entries require several independent technical validations
- **Precision Entry Timing** — optimized for moments of decisive market movement
- **Built-In Risk Structure** — controlled exposure and predefined exit logic on every trade

Performance Philosophy

- Tested across extended historical periods and varying market environments
- Focused on consistency, drawdown limitation, and capital preservation
- Avoids over-trading by operating only under favorable conditions

Access & Availability

This algorithm is not publicly available and is provided by invitation only.

Available exclusively as:

- **Invite-Only TradingView Indicator**
Manual execution based on real-time alerts and on-chart signals
